Dear Marshall,

I just got your A2B5-conditioned medium and thank you very much. Phil asked me in a recent letter about the antibody staining results I obtained with your antibodies. I have done only one experiment. A copy of my records is included. After this, Marie Neale did a few more experiments, the records of which should be in her hands. As a summary of the positive results I obtained:

14H3: Stained cell body on large DRG. Many DRG neurons negativ. Questionable? Staining of subclass?

16G6: DRG cell bodies and fine processes. Processes intenser than cell bodies.

18B8: DRG cell somas and axons. Stains subpopulation.

Spinal Cord cell bodies and axons. Intense dots on axons: boutons?

97C4: Stains extracellular matrix of DRG culture.

A2-B5: DRG cell bodies and axons. Non-neuronal cells.

94C2: Staining of certain flat background cells.

These are all the data I have. If I can be of any further help, please let me know.

Thanks again.

Best wishes,

DEC 24 1984
